BRIGHT COFFEE SHOP SALE ANALYSIS

BY : PRUDENCE MOHLALA

INTRODUCTION

This analysis provides a comprehensive overview of Bright Coffee Shop’s performance using six months of historical transactional data. It focuses on identifying key revenue drivers, understanding customer behavior patterns, and evaluating product performance to support strategic decision-making and drive revenue growth

REVENUE TRENDS BY DAY OF THE WEEK

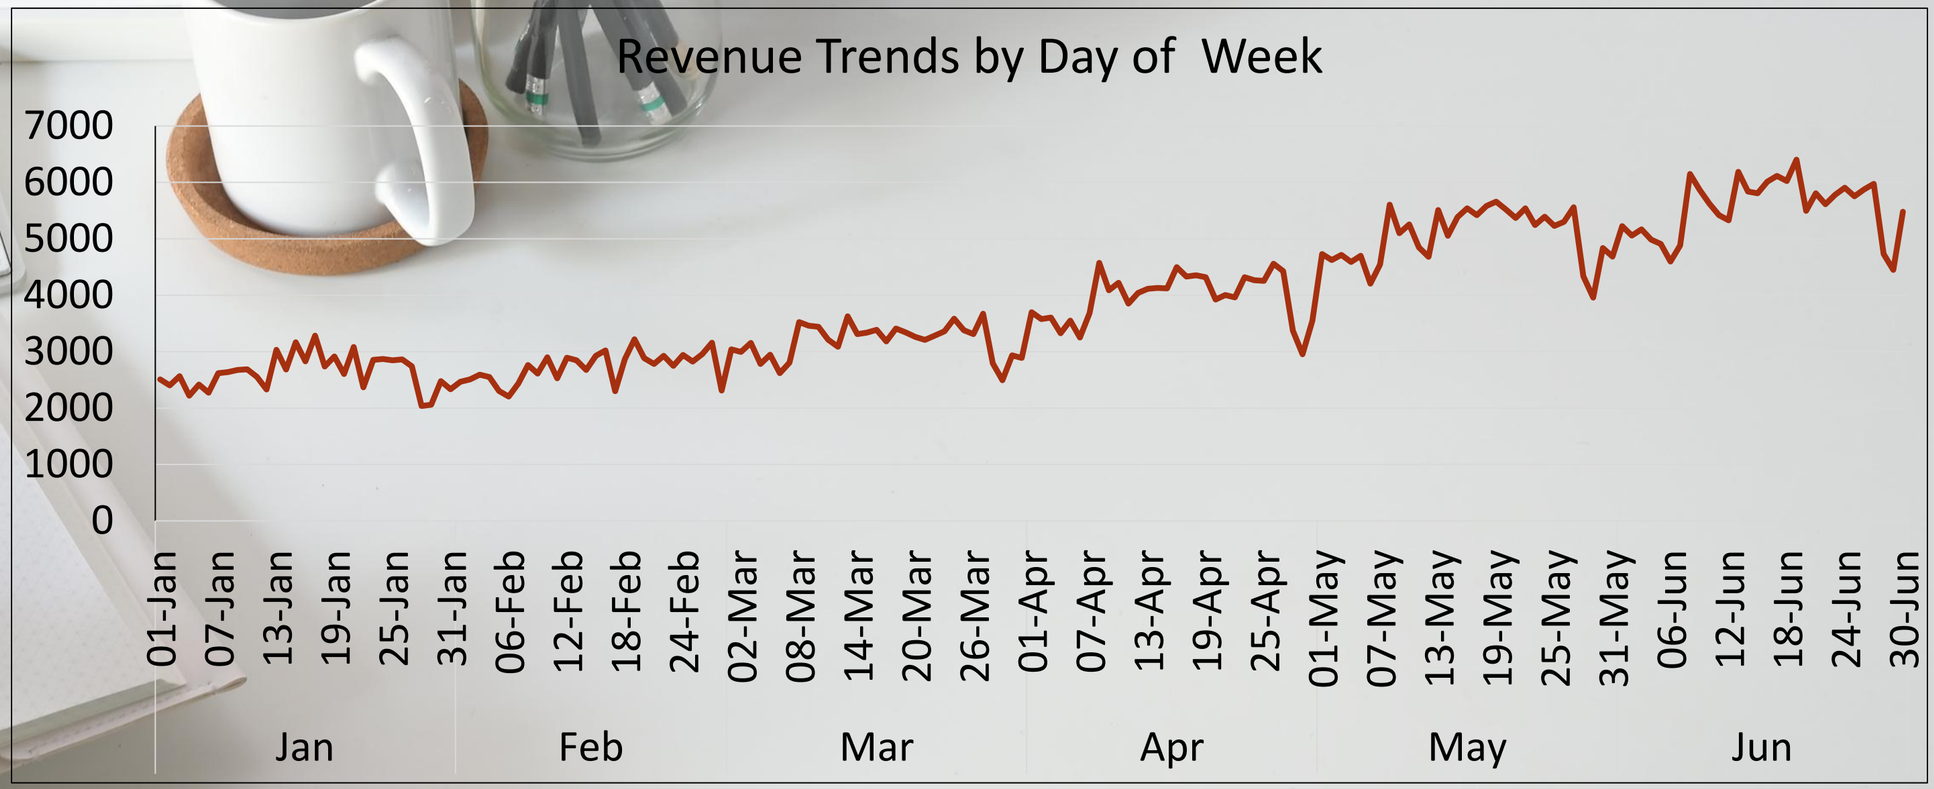

Figure 1. Revenue trends show variability over time, with a clear upward movement from late March through to mid-June. Periodic declines are observed in early March, late April, and late May, where revenue levels drop below the overall average. This indicates seasonal purchasing behavior, with increased sales during colder periods, likely driven by higher consumption of hot beverages.

REVENUE BY PRODUCT CATEGORY

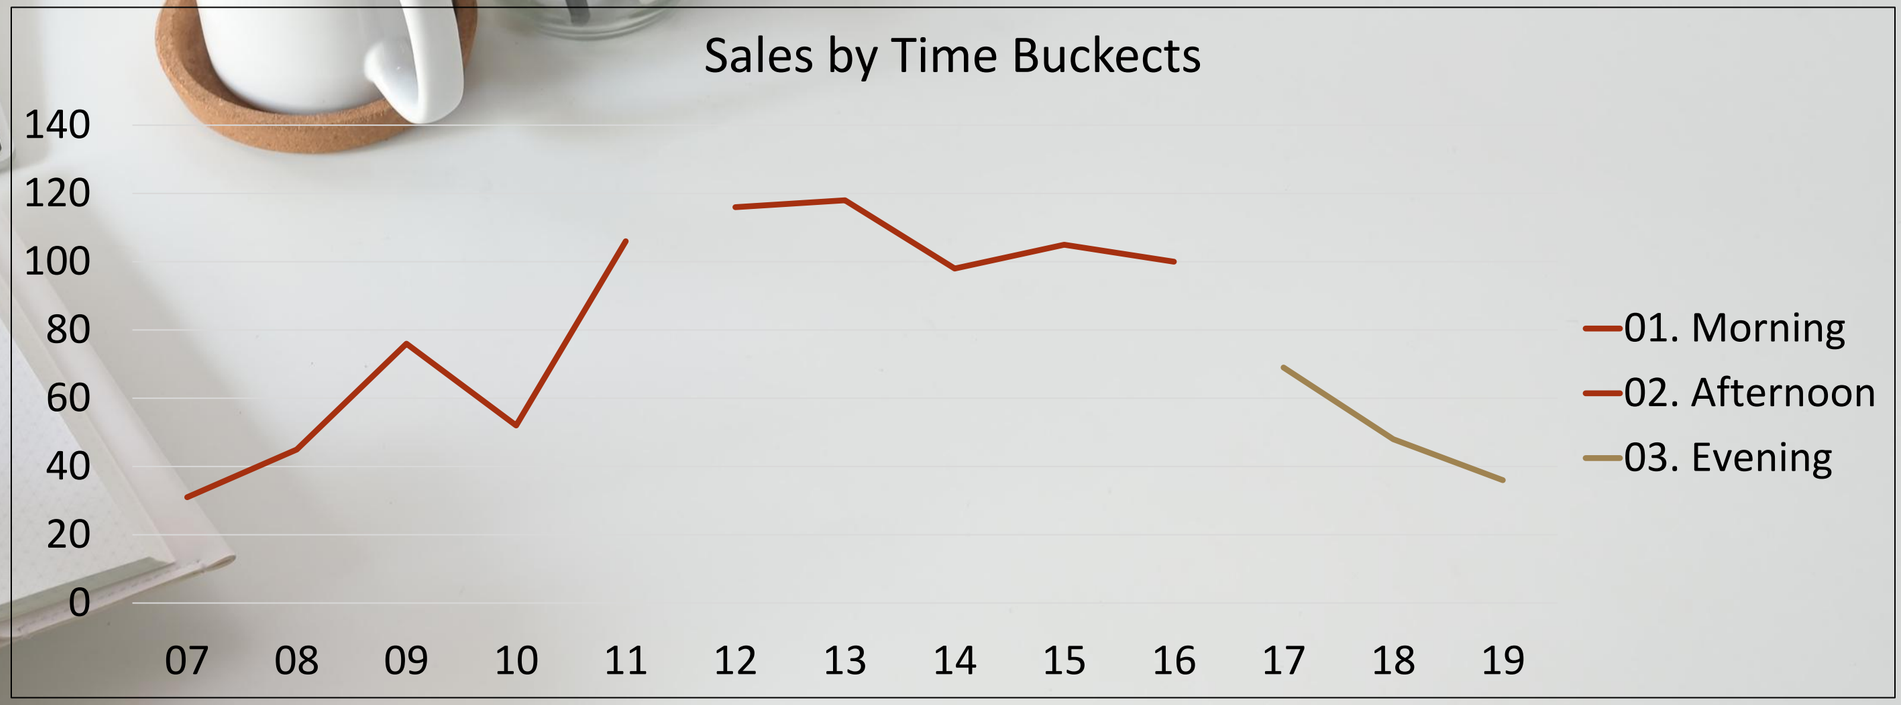

Figure 2. Sales distribution varies across the day, with the afternoon period generating the highest revenue levels. This trend likely reflects increased customer demand during lunchtime hours, highlighting midday as a critical window for revenue generation.

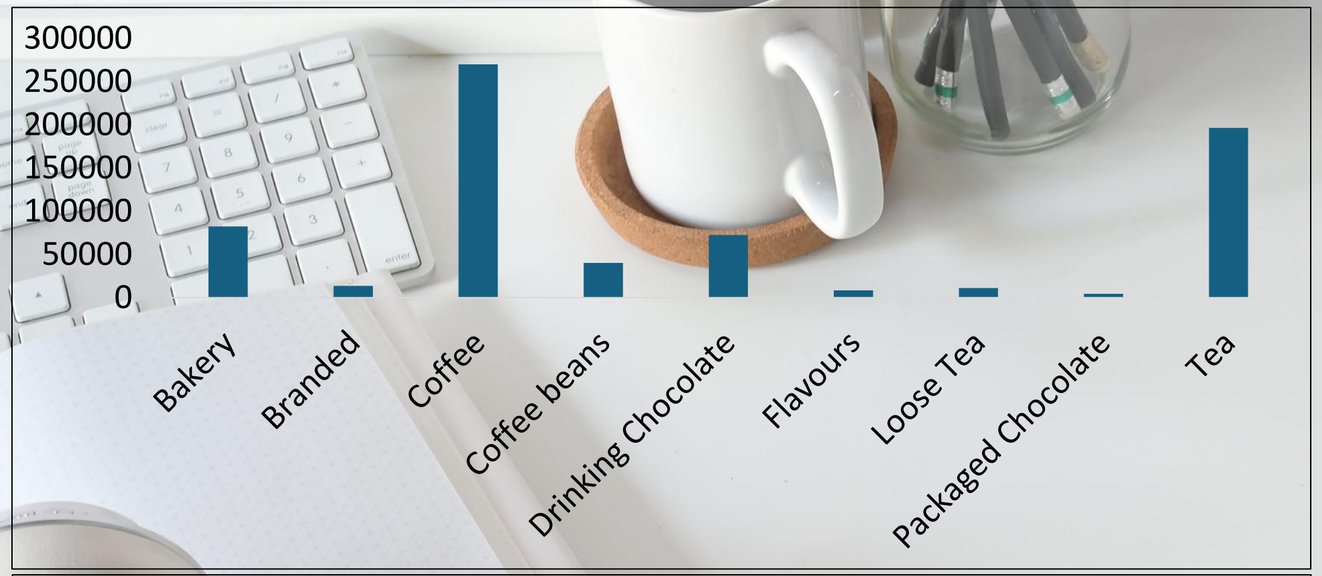
HEATMAP (DAY vs TIME)

Count of revenue_per_day	Column Labels									
	01. Morning		01. Morning Total	02. Afternoon		02. Afternoon Total	03. Evening		03. Evening Total
Row Labels	Sun	Mon		Sun	Mon		Sun	Mon	
07	17	14	31						
08	19	26	45						
09	43	33	76						
10	26	26	52						
11	51	55	106						
12				59	57	116			
13				63	55	118			
14				47	51	98			
15				43	62	105			
16				44	56	100			
17							54	15	69
18							48		48
19							36		36

Figure 3. Sales activity is concentrated during the afternoon period, with peak performance occurring between 12:00 and 15:00. Morning sales gradually increase towards late morning, while evening sales show a noticeable decline. This indicates that the business experiences its highest customer demand during midday hours, making this the most critical period for revenue generation.

REVENUE BY PRODUCT CATEGORY



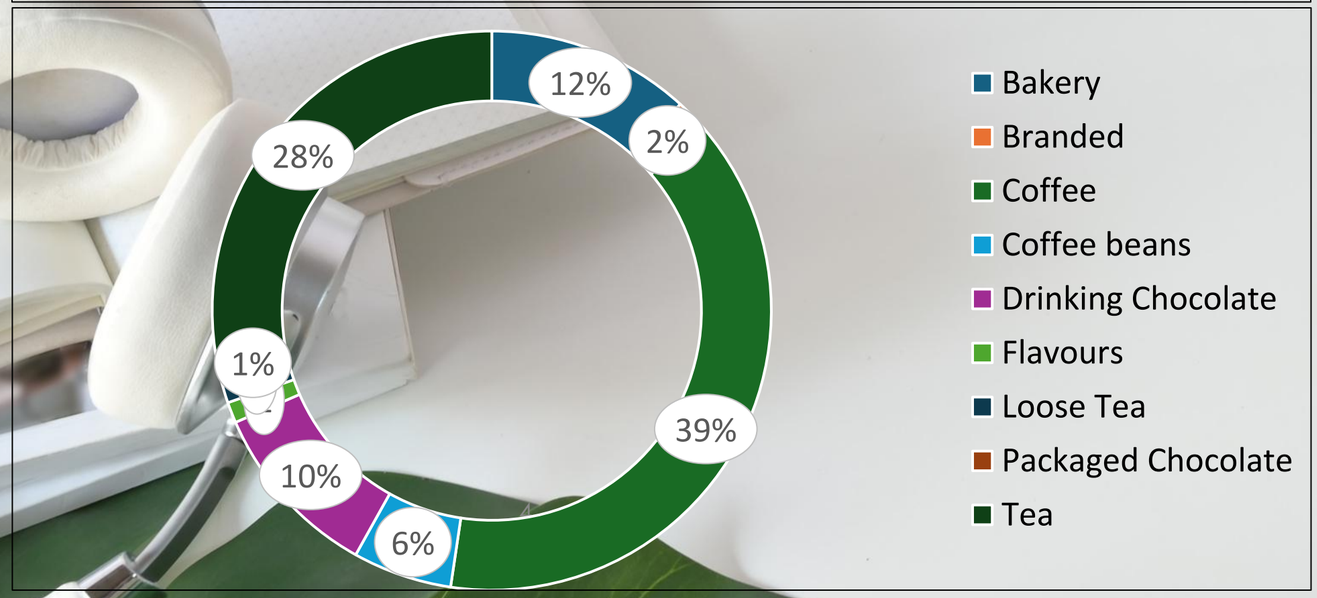


Figure 4.1 & 4.2. Coffee dominates revenue contribution, with tea as the next strongest category, reinforcing their position as the business's primary revenue drivers. This suggests a need to prioritize these categories in promotional efforts and stock planning.

Underperforming product categories should be evaluated for targeted promotion or potential rationalization. Furthermore, introducing bundled offerings such as bakery items paired with coffee or tea can increase average transaction value and encourage cross-selling.

TOP 10 BEST SELLING PRODUCTS

Figure 5. The top 10 best-selling products account for a significant share of total revenue, led by large-sized and premium beverage offerings such as Sustainably Grown Organic (Large) and Dark Chocolate (Large). Core menu items like Latte and Cappuccino also feature prominently, reinforcing their importance in daily sales performance.

This indicates a strong customer preference for high-value and larger-sized beverages, with revenue concentrated among a small group of top-performing products. To maximize revenue, these products should be prioritized in stock management, pricing strategies, and targeted promotions.

Time vs PRODUCT CATEGORY

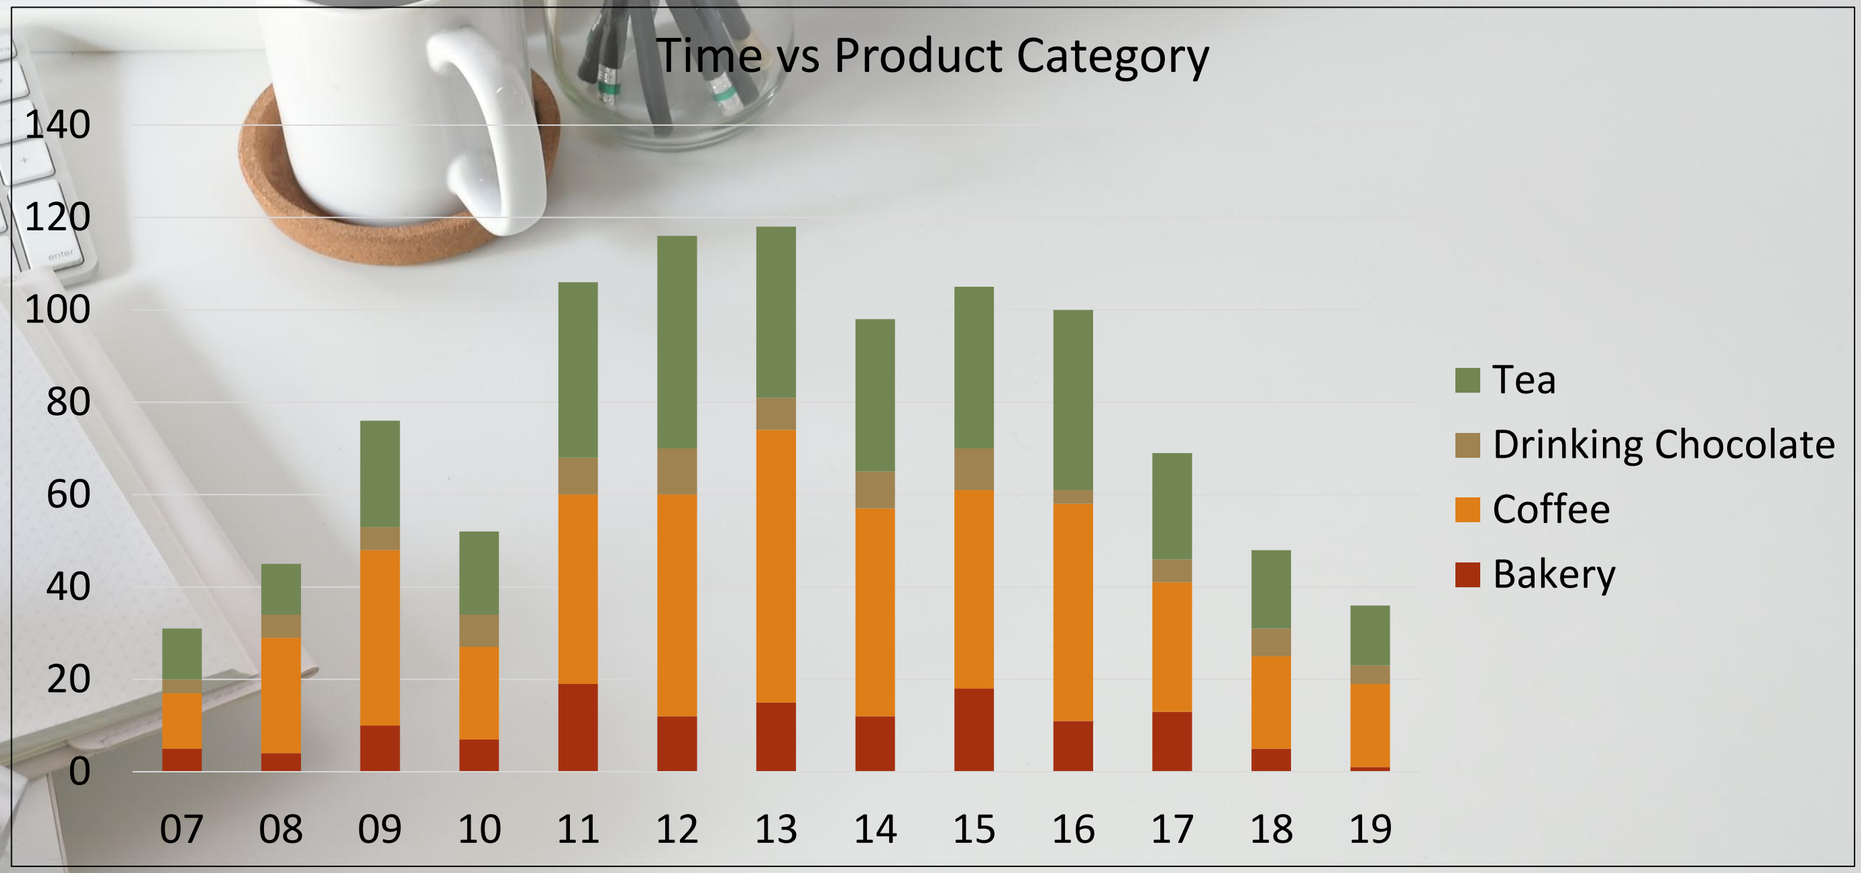

Figure 6. Coffee is the leading contributor to sales across all time periods, consistently outperforming other product categories. Tea provides stable support throughout the day, while drinking chocolate and bakery items contribute smaller but steady volumes. Overall sales peak during the afternoon hours, driven primarily by strong coffee demand.

SALES BY STORE LOCATION AND DAY

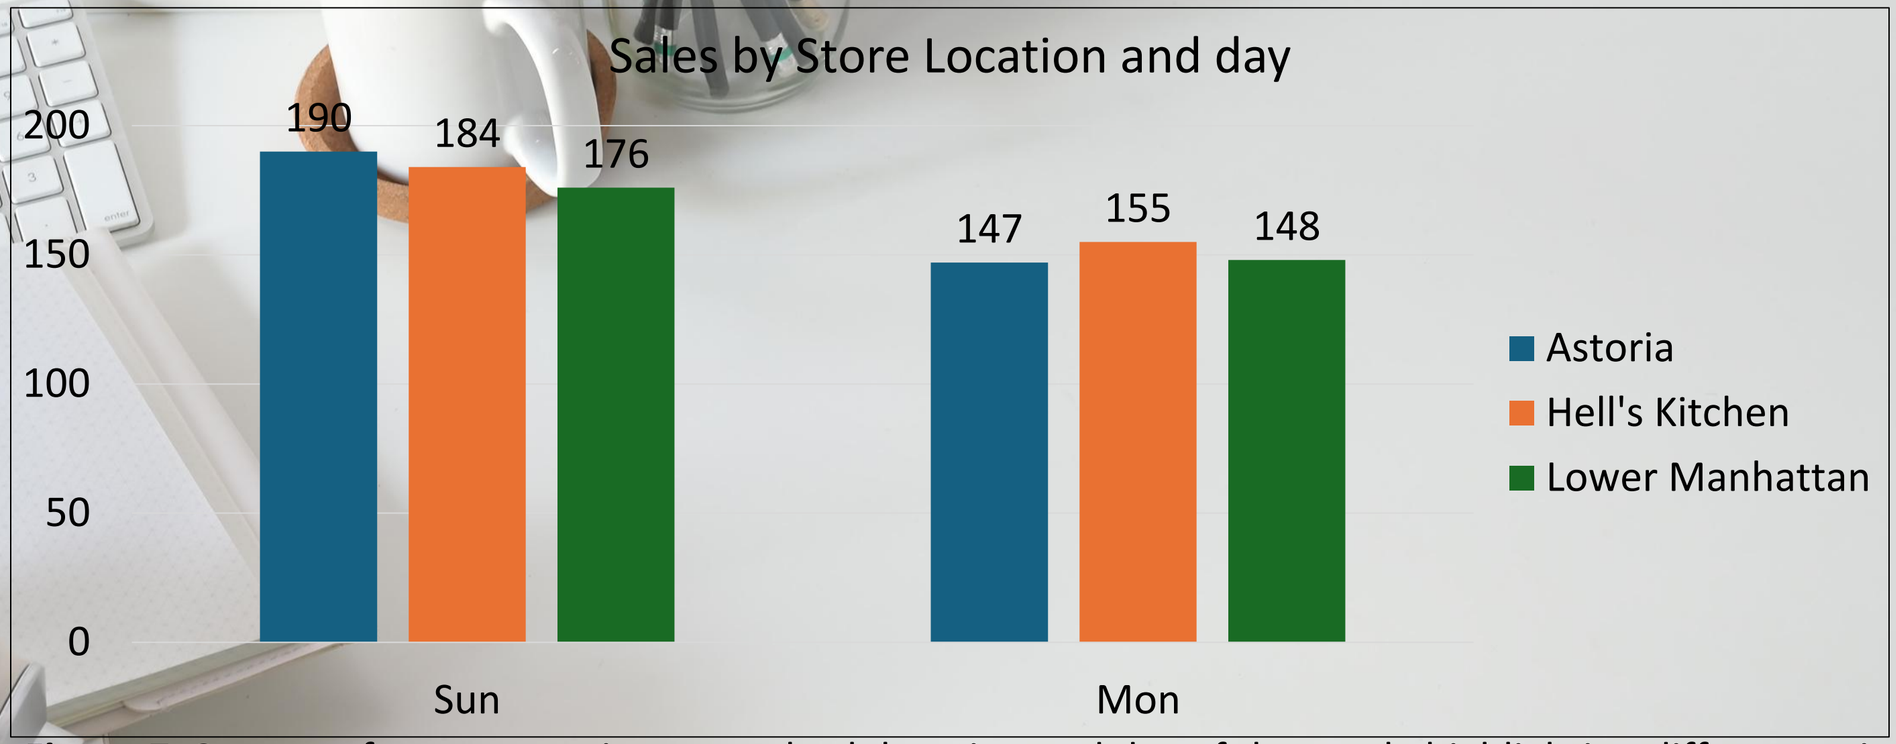

Figure 7. Store performance varies across both location and day of the week, highlighting differences in customer behavior by area. Hell's Kitchen records stronger sales on Mondays compared to Sundays, while Astoria and Lower Manhattan perform better on Sundays. This indicates that customer traffic patterns differ by location, likely influenced by surrounding activities and demographics.

Across all locations, Sunday emerges as the strongest performing day, with total sales averaging approximately 180 compared to around 150–160 on Mondays. This consistent uplift across stores suggests that weekends drive higher customer engagement, likely due to increased leisure activity and foot traffic.

PRODUCT CATEGORY SALES BY DAY

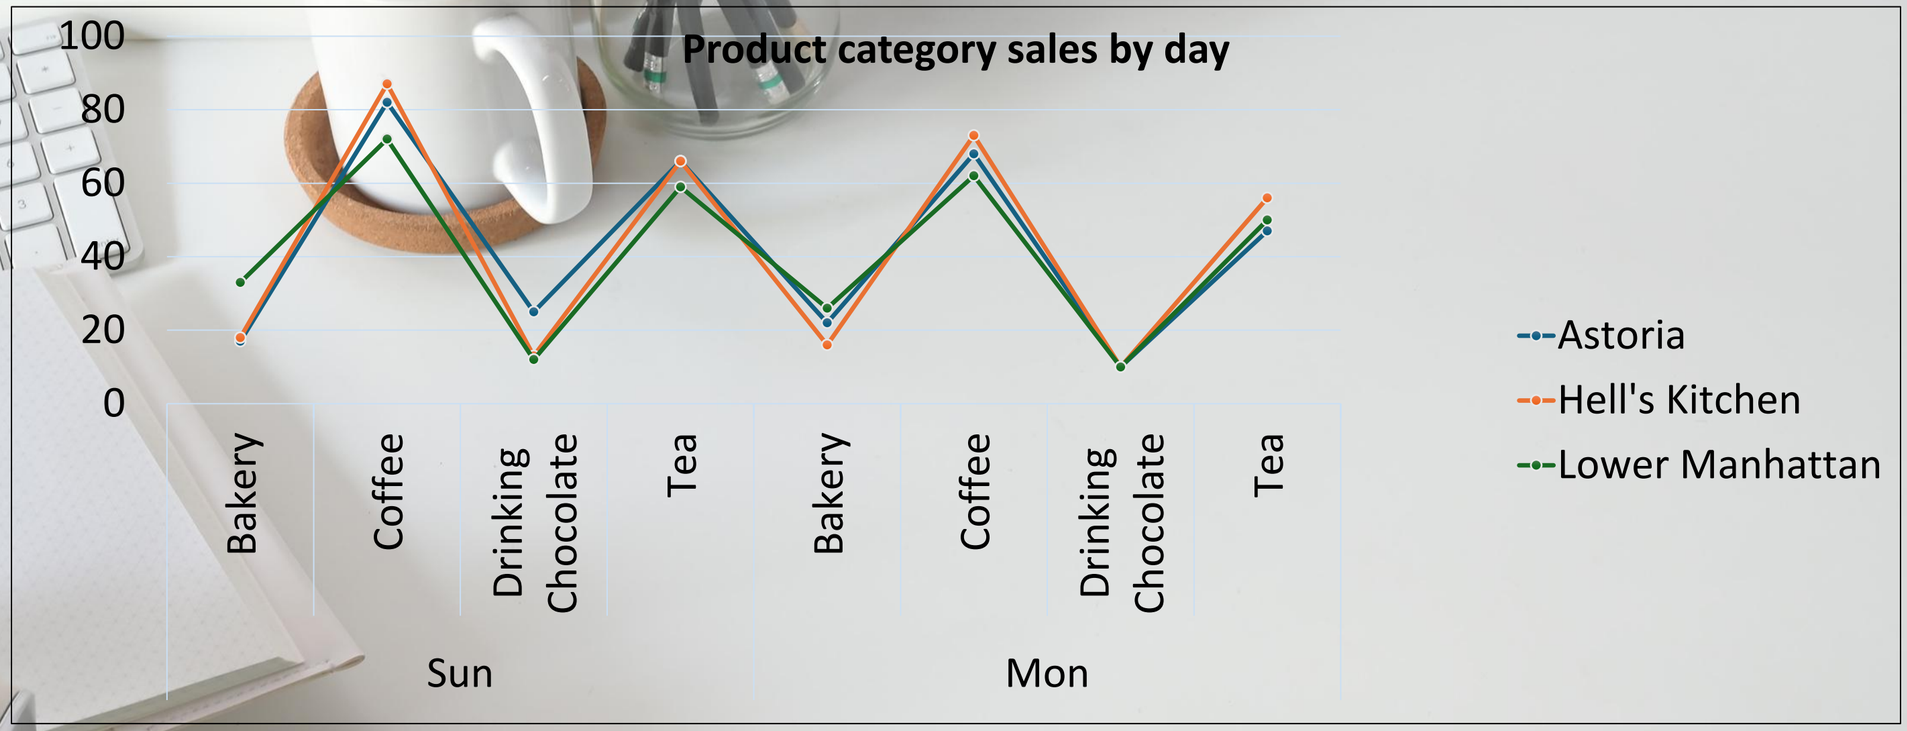

Figure 8. Product category performance remains relatively consistent across different days of the week, indicating stable customer preferences regardless of the day. Coffee and tea consistently lead in sales, significantly outperforming other categories such as drinking chocolate and bakery items.

This consistency suggests that core beverage offerings form the foundation of daily sales, with customers maintaining similar purchasing habits throughout the week. The dominance of coffee and tea highlights their importance as primary revenue drivers across all trading days.

TOTAL REVENUE BY STORE

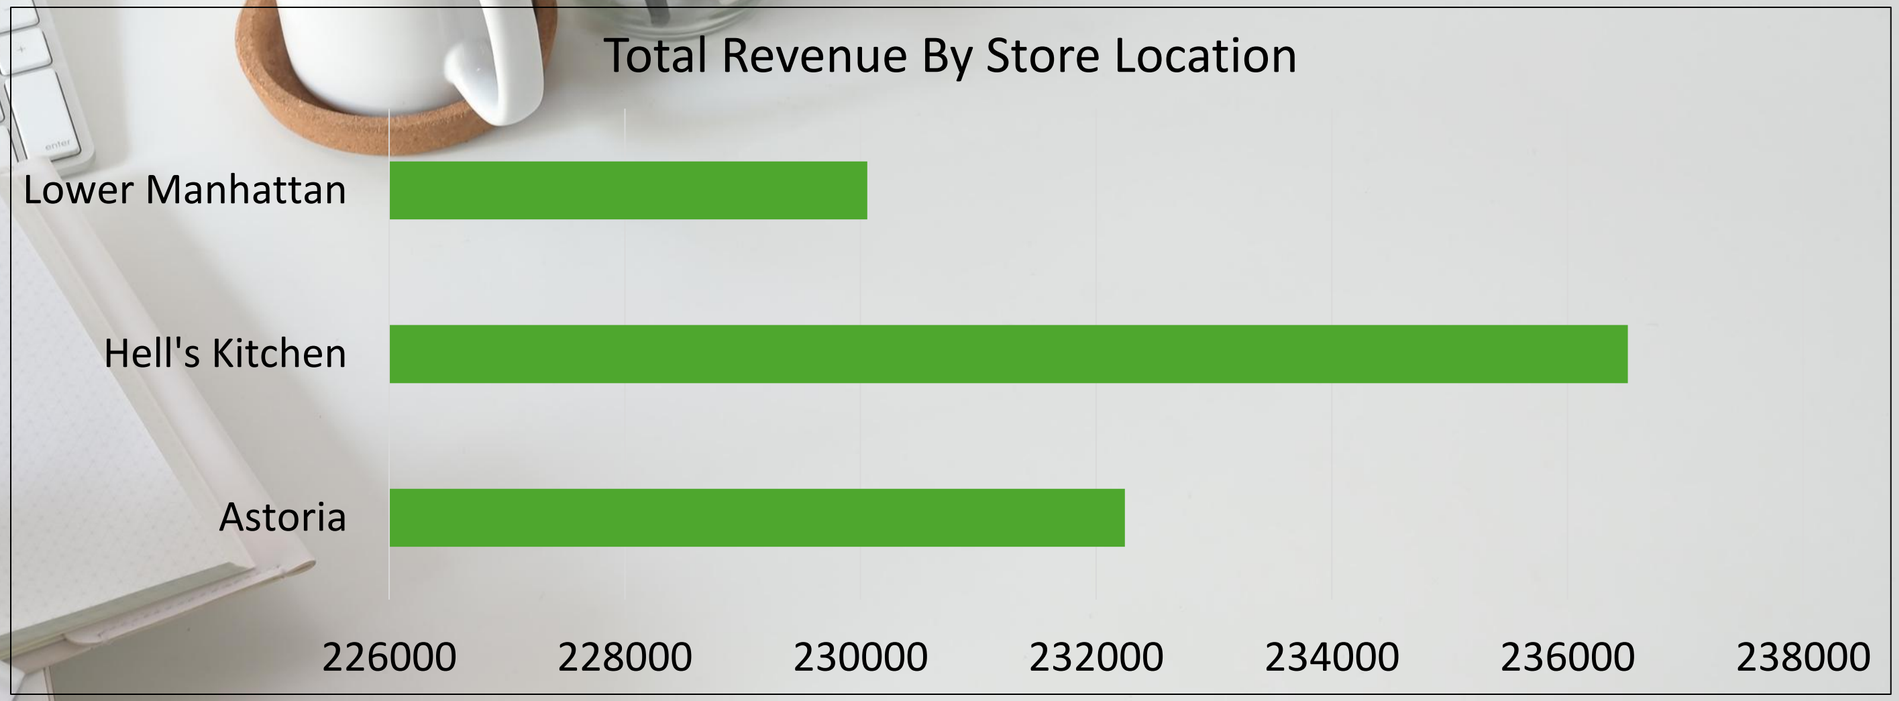

Figure 9. Revenue performance varies across store locations, with Hell's Kitchen emerging as the top-performing store, generating the highest total revenue among all locations. Astoria and Lower Manhattan follow closely, indicating relatively balanced performance across the business, with only moderate differences between stores.

The strong performance of Hell's Kitchen suggests potential advantages such as higher customer traffic, a more strategic location, or more effective operations. While the gap is not extremely large, it is consistent enough to position Hell's Kitchen as a key contributor to overall revenue.

RECOMMENDATIONS

- Focus marketing efforts on peak afternoon hours (12:00–15:00) to maximize revenue.
- Increase stock and visibility of top-performing products, especially large-sized beverages.
- Introduce bundle deals (e.g coffee + bakery items) to increase average transaction value.
- Implement targeted promotions during low-performing periods (early mornings and evenings) .
- Apply store-specific strategies, using high performing locations like Hell’s Kitchen as benchmarks .
- Promote underperforming categories (e.g drinking chocolate) through discounts or repositioning.
- Align staffing levels with peak demand periods to improve service efficiency .

CONCLUSION

The analysis highlights that revenue is primarily driven by a combination of time-based demand, product preference, and store performance. Afternoon hours, particularly between 12:00 and 15:00, represent the most critical sales window, while coffee and tea dominate as the main revenue-generating categories.

Although store performance is relatively balanced, slight variations indicate opportunities for location-specific optimization. Additionally, revenue is concentrated among a small number of high-performing products, emphasizing the importance of prioritizing these items in business strategy.

By leveraging these insights, the business can optimize operations, enhance customer experience, and implement targeted strategies to drive sustainable revenue growth.
